

Annex IV (plant study)

Summary

In April 2013, floral recordings were made at 20 sampling points as part of an on - site visit, in order to describe and contribute to detailed mapping of the habitats of the Special Protection Area of Andros.

Records of the flora were made on different places in 100 m² area in each place (recording of plant species and their growth). This report summarizes the plant species, as well as the coverage on each surface. Key factors are included in the description of each location: location, type of habitat, coordinates, altitude, total number of plant species and observations.
